Monroe County Medical Society Community-wide Guidelines

Prevention, Diagnosis and Management of Coronary Artery Disease

**Purpose**
To identify and promote the essential elements to preventing, diagnosing, and managing coronary artery disease in adults.

**Key Recommendations**
- Conduct aggressive risk factor management for coronary artery disease beginning at age 20.
- Advise patients about importance of lifestyle as the foundation for risk reduction prior to and during cholesterol-lowering therapy: heart healthy diet; maintenance of a healthy weight; regular aerobic physical activity; avoidance of tobacco products (including electronic nicotine delivery systems [ENDS])/cessation of tobacco use and reducing exposure to second-hand smoke.
- Initiate beta-blockers, ACE inhibitors, and antiplatelet agents. ACE inhibitors and antiplatelet agents should be considered for indefinite use if no contraindication. The duration of therapy with beta-blockers must be weighed against potential for adverse effects associated with these agents including heart failure and cardiogenic shock.
- ASA Therapy:
  1) **Primary Prevention** – The Food and Drug Administration does not recommend aspirin therapy as preventive medicine in people who have not already had a heart attack, stroke or other cardiovascular conditions. The USPSTF recommends low dose aspirin for persons aged 50-59 years for primary prevention of cardiovascular disease who have a 10% or greater 10 year CVD risk, are not at increased risk for bleeding, have a life expectancy of at least 10 years, and are willing to take low-dose aspirin daily for at least 10 years. As of 2015, the United States Preventive Services Task Force updated its 2009 recommendation for Aspirin for the Prevention of Cardiovascular Disease – Primary Prevention:
    - **Men, Age 45-79** The USPSTF recommends the use of aspirin for men age 45 to 79 years when the potential benefit due to a reduction in myocardial infarctions outweighs the potential harm due to an increase in gastrointestinal hemorrhage. See the Clinical Considerations section for discussion of benefits and harms.
    - **Women, Age 55-79** The USPSTF recommends the use of aspirin for women age 55 to 79 years when the potential benefit of a reduction in ischemic strokes outweighs the potential harm of an increase in gastrointestinal hemorrhage. See the Clinical Considerations section for discussion of benefits and harms.
    - **Men and Women, 80 Years and Older** The USPSTF concludes that the current evidence is insufficient to assess the balance of benefits and harms of aspirin for cardiovascular disease prevention in men and women 80 years or older. See the Clinical Considerations section for suggestions for practice regarding the statement.
    - **Women Younger than 55 (Stroke), Men Younger than 45 (MI)** The USPSTF recommends against the use of aspirin for stroke prevention in women younger than 55 years and for myocardial infarction prevention in men younger than 45 years.

  2) **Secondary Prevention** – 2 or more risk factors, especially those with CHD 10 yr risk of ≥ 10%, and no contraindications, prescribe 81-162 mg/QD.
  - Monitor blood pressure. Treat to blood pressure target levels: <130/80 mm Hg and <140/90 mm Hg with no diabetes and no kidney disease.a

*NOTE: The 2017 ACA/AHA Guideline for the Prevention, Detection, Evaluation and Management of High Blood Pressure in Adults classifies hypertension as a BP reading of 130/80 mm Hg or higher.*

---

a. ACC/AHA Task Force on Clinical Practice Guidelines November 13, 2017

Guidelines are intended to be flexible. They serve as reference points or recommendations, not rigid criteria. Guidelines should be followed in most cases, but there is an understanding that, depending on the patient, the setting, the circumstances, or other factors, care can and should be tailored to fit individual needs.

Monroe County Medical Society Community-wide Guidelines

Prevention, Diagnosis and Management of Coronary Artery Disease

High Risk Populations/Disparities

- Cancer and heart disease are the leading causes of premature death (average years of potential life lost before age 75 (YPLL) in Monroe County from 2010 to 2014. County-wide, the average YPLL is 6.4 years. The average YPLL is two times higher in the city compared to the suburbs and more than 3 times higher among African American and Latino residents compared to White residents.1

- Two conditions that are risk factors for heart disease include diabetes and high blood pressure. Ten percent (10%) of Monroe County adults have diabetes, and 32% have high blood pressure.1

Rates are higher among those age 35 and older and there are significant disparities by race/ethnicity and geography as shown in the table below.

*Statistical significance p<0.05, City compared to Suburbs. ** Statistical significance p<0.05 African American and Latino compared to White.

<table>

Quality Measures Commonly Used by National Organizations

- Antiplatelet Therapy: Percentage of patients aged 18 years and older with a diagnosis of coronary artery disease (CAD) seen within a 12 month period who were prescribed aspirin or clopidogrel (MIPS)

- Beta-Blocker Therapy - Prior Myocardial Infarction (MI) or Left Ventricular Systolic Dysfunction (LVEF < 40%): Percentage of patients aged 18 years and older with a diagnosis of coronary artery disease seen within a 12 month period who also have a prior MI or a current or prior LVEF <40% who were prescribed beta-blocker therapy (MIPS)

- Angiotensin Converting Enzyme (ACE) Inhibitor or Angiotensin Receptor Blocker (ARB) Therapy: Percentage of patients aged 18 years and older with a diagnosis of coronary artery disease seen within a 12 month period who also have diabetes OR a current or prior Left Ventricular Ejection Fraction (LVEF) < 40% who were prescribed ACE inhibitor or ARB therapy (MIPS)

- Symptom Management: Percentage of patients aged 18 years and older with a diagnosis of coronary artery disease seen within a 12 month period with an evaluation of level of activity and an assessment of whether anginal symptoms are present or absent with appropriate management of anginal symptoms within a 12 month period. (SIHD)

a. ACC/AHA Task Force on Clinical Practice Guidelines November 13, 2017

Guidelines are intended to be flexible. They serve as reference points or recommendations, not rigid criteria. Guidelines should be followed in most cases, but there is an understanding that, depending on the patient, the setting, the circumstances, or other factors, care can and should be tailored to fit individual needs.

Monroe County Medical Society Community-wide Guidelines

Prevention, Diagnosis and Management of Coronary Artery Disease

Prevention and Diagnosis

Initial Assessment of Risk Factors - Beginning at Age 20 to Include

- Family History
- Smoking Status and Readiness to Change
- Blood Pressure
- Fasting Lipid Panel
- Dietary and Physical Activity Assessment
- BMI Calculation
- Past Medical History Assessment (including history of atrial fibrillation and diabetes)
- Waist Circumference
- Other illnesses including (e.g.) psoriasis have been associated with an increased risk of CAD.

Clinical Identification of Metabolic Syndrome – Any 3 of the Following:

- Waist Circumference $\geq 40$” (men), $\geq 35$” (women)
- Blood Pressure $\geq 130/\geq 85$ mm/Hg
- Fasting Glucose $\geq 100$ mg/dL
- Triglycerides $\geq 150$ mg/dL
- HDL Cholesterol $< 40$ mg/dL (men), $< 50$ mg/dL (women)

Assess and treat underlying causes

Blood Pressure

- Treat to blood pressure target levels: $< 130/80$ mm Hg and $< 140/90$ mm Hg with no diabetes and no kidney disease$^{1,2}$
- Prescribe life style modifications (e.g. effectiveness of regular aerobic exercise, moderation of sodium intake, a DASH eating plan or a Mediterranean style diet with emphasis on eating foods like fish, fruits, vegetables, beans, high-fiber breads and whole grains, nuts, and olive oil while limiting meats, cheeses, and sweets. This can be equivalent to drug monotherapy).
- Initial antihypertensive treatment:
  - In general nonblack population, including those with diabetes, initial antihypertensive treatment should include a thiazide-type diuretic, calcium channel blocker (CCB), angiotensin-converting enzyme inhibitor (ACEI), or angiotensin receptor (ARB).
  - In the general black population, including those with diabetes, initial antihypertensive treatment should include a thiazide-type diuretic or CCB.$^3$
  - In the population aged $\geq 18$ years with CKD (including all CKD patients with hypertension regardless of race or diabetes status), initial (or add-on) antihypertensive treatment should include an ACEI or ARB to improve kidney outcomes.

(See Monroe County Medical Society (MCMS) Community-wide Guideline for Management of Hypertension for complete recommendations.)

Guidelines are intended to be flexible. They serve as reference points or recommendations, not rigid criteria. Guidelines should be followed in most cases, but there is an understanding that, depending on the patient, the setting, the circumstances, or other factors, care can and should be tailored to fit individual needs.

Contraindications

(3) CCTA is reasonable only for patients

Consider coronary revascularization to improve symptoms

Intermediate to high likelihood

or the Diagnosis and Management of Patients With Stable Ischemic Heart Disease

Guidelines are intended to be flexible. They serve as reference points or recommendations, not rigid criteria. Guidelines should be followed in most cases, but there is an understanding that, depending on the patient, the setting, the circumstances, or other factors, care can and should be tailored to fit individual needs.

Figure 4) (3)

Diagnosis of Patients with Suspected Coronary Artery Disease *

Suspected Coronary Artery Disease (or change in clinical status in a patient with known CAD)

Intermediate or high-risk UA (1)

See ACCF/AHA UA/NSTEMI Guideline

Symptoms or findings suggest high-risk lesion(s) (2)

OR Prior aborted sudden cardiac death or serious ventricular arrhythmia OR Prior stent in unprotected left main coronary artery

Contraindications to stress testing

Comprehensive clinical assessment of risk, including personal characteristics, coexisting cardiac and medical conditions, and health status

Reant exercise or cardiac imaging study

Technically adequate

Low likelihood CAD

Intermediate to high likelihood CAD

Patient able to exercise

Previous coronary revascularization

Low likelihood CAD

Intermediate likelihood CAD

Intermediate to high likelihood CAD

Test results suggest high-risk coronary lesion(s)

Initiate Guideline-Directed Medical Therapy: consider coronary revascularization to improve survival (See 2012 ACCF/AHA/ACP/AATS/PCNA/SCAI/STS Guideline for the Diagnosis & Mgmt of Patients with Stable Ischemic Heart Disease, Figure 6) (3)

Guidelines are intended to be flexible. They serve as reference points or recommendations, not rigid criteria. Guidelines should be followed in most cases, but there is an understanding that, depending on the patient, the setting, the circumstances, or other factors, care can and should be tailored to fit individual needs.
Lipid Management

<table>
<thead>
<tr>
<th>Statin Benefit Patient Groups(1)</th>
<th>Recommended Statin Treatment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Age ≤75 yrs with no statin-related safety concerns</td>
<td>High-intensity statin</td>
</tr>
<tr>
<td>Age &gt;75 yrs or not a candidate for high-intensity statins</td>
<td>Moderate-intensity statin</td>
</tr>
<tr>
<td>Familial hypercholesterolemia (candidates for statin therapy)</td>
<td>High-intensity statin, (If not a candidate for high-intensity statin, moderate tolerated statin)</td>
</tr>
<tr>
<td>Estimated 10-yr ASCVD risk &lt;7.5%</td>
<td>Moderate-intensity statin</td>
</tr>
<tr>
<td>Estimated 10-yr ASCVD risk ≥7.5%</td>
<td>High-intensity statin</td>
</tr>
<tr>
<td>Estimated 10-yr ASCVD risk ≥7.5%</td>
<td>Moderate to high-intensity statin</td>
</tr>
<tr>
<td>Estimated 10-yr ASCVD risk 5 – &lt; 7.5%</td>
<td>Consider use of moderate-intensity statin. (Moderate evidence available to support. Discuss risks/benefits with patient.)</td>
</tr>
</tbody>
</table>

For patients who do not fall into the above statin-benefit groups, physicians and patients should engage in a discussion regarding the risks and benefits of PCSK9 therapy.

Consider pill splitting or generic equivalents as available to increase patient compliance.

Risk Intervention

**Lifestyle Modifications**

- Physical activity of at least 150 min/wk of moderate-intensity aerobic activity over at least 5 days/wk or 75 min/wk of vigorous-intensity aerobic activity over at least 3 days/wk and muscle-strengthening activities on 2 or more days/wk that work all major muscle groups.
- Dietary Intake: Diet plays a role in management: moderation of sodium intake, a DASH eating plan or a Mediterranean style diet can be beneficial and should be considered with emphasis on eating foods like fish, fruits, vegetables, beans, high-fiber breads and whole grains, nuts, and olive oil while limiting meats, cheeses, and sweets.
- Weight Management to achieve and maintain BMI at 18.5 – 24.9 Kg/m², waist circumference at iliac crest level ≤ 40” in men & ≤ 35” in women.
- Complete smoking cessation. Provide appropriate counseling, pharmacotherapy and referral to formal cessation programs. No exposure to environmental smoke. (See MCMC Community-wide Guideline for Treating Tobacco Use and Dependence).

**Blood Lipid Management**

Initiate therapeutic lifestyle changes and consider drug therapy.

**Diabetes Management**

Initiate appropriate therapy to achieve an A1c < 7.0% (goals should be individualized based on age, comorbid conditions, duration of diabetes, individual patient considerations and other factors.) (See MCMC Community-wide Guideline for Diabetes Care). Every attempt should be made to identify patients at risk for diabetes (insulin resistance, glucose intolerance, obesity, family history, poor diet and exercise habits) to allow early intervention with diet and lifestyle changes to prevent the development of frank diabetes.

**ASA Therapy**

- Primary Prevention - The Food and Drug Administration does not recommend aspirin therapy as preventive medicine in people who have not already had a heart attack, stroke or other cardiovascular conditions. See USPSTF Aspirin Therapy for persons aged 50-59 year under Key Recommendations on page 1. As of 2015 the United States Preventive Services Task Force updated its recommendation for Aspirin for the Prevention of Cardiovascular Disease – Primary Prevention.
- Secondary Prevention - 2 or more risk factors, especially those with CHD 10yr risk of ≥10%, and no contraindications–prescribe 81-162 mg/QD.

**Depression Screening**

Screen for depression (See MCMC Community-wide Guideline for Major Depressive Disorder)

**Disease Management Support**

- One to one interaction for personal education and support.
- Resource tools to assist with self management of chronic conditions

*Adapted from 2013 ACC/AHA Guideline on the Treatment of Blood Cholesterol to Reduce Atherosclerotic Cardiovascular Risk in Adults: A Report of the American College of Cardiology/American Heart Association Task Force on Practice Guidelines

1. Characteristics that may predispose patients to statin adverse effects include, but are not limited to: multiple or serious comorbidities, including impaired renal, hepatic function; hx of previous statin intolerance or muscle disorders; unexplained ALT elevations >3 X ULN; age >75 yrs. 2. Atherosclerotic Cardiovascular Disease (ASCVD) defined as acute coronary syndrome, history of myocardial infarction, stable or unstable angina, prior coronary or other arterial revascularization, stroke, transient ischemic attack, or peripheral arterial disease presumed to be atherosclerotic.

Guidelines are intended to be flexible. They serve as reference points or recommendations, not rigid criteria. Guidelines should be followed in most cases, but there is an understanding that, depending on the patient, the setting, the circumstances, or other factors, care can and should be tailored to fit individual needs.

*Goals should be individualized based on age/life expectancy, duration of diabetes, comorbid conditions, individual patient considerations and other factors.*

**Consider annual reassessment of the need for antiplatelet/anticoagulant therapy.**

**METABOLIC SYNDROME INCLUDES ANY 3 OF THE 5 DIAGNOSTIC MEASURES:**

- **Waist Circumference** (men ≥40", women ≥35")
- **BP** ≥130/≥85 mm Hg
- **FBG** ≥100 mg/dL
- **Triglycerides** ≥150 mg/dL
- **HDL cholesterol** (men <40 mg/dL, women <50 mg/dL)

*Guidelines are intended to be flexible. They serve as reference points or recommendations, not rigid criteria. Guidelines should be followed in most cases, but there is an understanding that, depending on the patient, the setting, the circumstances, or other factors, care can and should be tailored to fit individual needs.*
